ANNOTATION Environmental values play an important role in improving the ecological environment, protecting nature, and at the same time strengthening people's health. In this written article, we talk about bringing ecological values to a higher level, regularly connecting them with our daily lifestyle. At the same time, some types of activities that should be transformed into ecological values were discussed.

KEYWORDS: ecological attitude, mountains, rivers, beaches, lakes, nature parks, fields, zoo, ecological participation, ecological sensitivity, ecological respect.

INTRODUCTION

Among the environmental values that we humans can apply in practice are environmental protection, careful attitude to it, environmental responsibility, connection with the natural environment, and others. To change the direction of the environment, it is important to build environmental values from all areas.

Ecological values are criteria that determine benefits for the environment. From there it is understood that respect, attention and care for the environment we live in, as well as the healthy transfer of nature to the future generation. It is very important to connect these values in order for students to become adults who have learned throughout their lives that they are sensitive, balanced and fair with the environment. Here we present to you what these values are and how to apply them most effectively.

Ecological values are related to the principles that determine how a person behaves in front of the natural environment that surrounds him. So positive actions are part of balance, wise use and respect for the resources that nature gives us. In short, this is an educational process that allows to increase awareness of the role of a person in relation to the environment and to teach based on historical values.

MAIN PART

Man must learn to be in harmony with the environment, to preserve, protect and preserve the natural environment, its ecosystems and, above all, respect for living beings. This should be considered as a form of compensation for the damage caused to nature over a long period of time. Therefore, environmental education is becoming increasingly necessary as a way to raise awareness among adults and the youngest to be responsible. Therefore, instilling values from boys and girls at an early age is necessary and should be a priority. Parents, who are primarily

responsible for initiating this task, must work together with educators and governments to promote home, school, and community values that enable environmental stewardship for sustainable development.

Simple actions can significantly reduce direct and indirect negative impacts on the environment, allowing nature to recover and stabilize itself. Learning and applying effective environmental values as a part of our daily work can have many positive results and make the educational process meaningful.

Consequently, the loss of human values and, therefore, the crisis of not inculcating ecological values into society is destroying the environment, its natural elements, and human health. As these play an important role to transform the country and society, in a world that manages the ecological balance to improve the quality of life for all.

An understanding of ecological values can guide the path to harmony with the environment, the importance of which affects the quality of life on the planet.

Is to protect and strengthen based on balance and respect for the natural elements. In the process of education, love and respect for nature is achieved, citizens with a sense of morality, efforts to save and live with respect improve their relationship with the environment.

Every day our planet suffers serious injuries due to the irresponsible actions of us humans. This is due to the lack of sensitivity, culture and education that promotes love and respect for the environment. Ecological values can be applied with more simple, simple actions from the environment, but this allows them to take care of the area in which we live and thus achieve a truly sustainable development.

Thus, values are the ecological actions, actions and positive behaviors of a person with the environment. By appreciating all their natural resources and using them consciously. Environmental values guide people to practice environmental protection and improvement practices. Therefore, just as there are human values, there are also social values, the application of which in nature leads to the improvement of the ecological environment. Among the main environmental values that should be inculcated and encouraged in the educational process of all mankind from an early age are:

✚ **Ecological love.** It is the only home and life to be cherished, cared for and preserved. This value is as important as love. You need to instill in children the example of how to love their parents. In this way, they can reflect this love while respecting the natural environment, plants, animals, ecosystems and all the essential elements for life on the planet. To love the environment is to teach them to care for and preserve the air, water, soil, flora and fauna. So, parents can visit mountains, rivers, beaches, lakes, nature parks, fields, zoos, aquariums and any other places that allow them to learn about the diversity of species and ecosystems in the environment. Children should be connected to nature through excursions that allow direct contact with activities.

✚ **Ecological respect.** Appreciation of the environment in accordance with the laws governing negative human impact. Couples should be respected and valued, and their children should respect their surroundings and the diversity of living things that exist on the planet. That is, parents should teach their children to be kind to animals, take care of them and not destroy their habitats. To show you the laws that protect the environment and must be obeyed to respect and value life.

✚ Environmental protection. Caring for and valuing our natural resources for future generations. Parents should teach their children to save natural resources for future generations.

✚ **Being in harmony with the ecological environment.** A balanced relationship of peace between man and nature is life. Children need to understand that the existence of the planet depends on the environment and its resources. Therefore, you should have a peaceful and harmonious relationship with nature. It does not destroy the value and vital resources to sustain life.

✚ **Environmental sensitivity.** To consider the problems presented by the environment and to be compassionate towards them. Parents should educate their children with environmental games, stories, songs, documentaries, videos, among other activities. This allows them to think about the same human-caused environmental problems that threaten the health of all people and the planet. Ecological initiatives, voluntary actions for the environment, awareness of the changes occurring in nature prevent negative consequences.

✚ **Ecological participation.** Collaborate and assist in programs and environmental campaigns. Parents should be involved with their children in environmental education programs that allow them to learn and work together to protect and care for the environment. it is necessary to participate as much as possible in activities related to nature.

CONCLUSION

In short, we need to promote values with the environment. Environmental education is a means of forming knowledge and habits that enable the active participation of parents, teachers, communities, governments and all societies in order to educate men and women about the environment. 'responsible for care.

Therefore, it is very important to educate environmental values in all children; where parents, teachers, governments and societies in general need to change these attitudes, behaviors and human behavior, as well as acquire new knowledge for a better society for the quality of life. That is, the formation of these ecological values are the principles and pillars of sustainable present and future generations.
